

PhD POSTER DAY 2021

On December 23, an annual poster presentation was held at Turin Polytechnic University in Tashkent. Ph.D. students of the university who study at the Department of “Mechanical Engineering” and Aerospace Engineering” and “Architecture and Civil Engineering” presented their report presentations to professors and teachers of the university on the results of their work for 2021. This is the second poster presentation of these doctoral students. It was noted that this year everything went at a higher level, doctoral students were more confident and much better-answered questions about their work.

Methods of substantiation of seismic resistance of buildings by the method of mathematical modeling

PHD Candidate
Kenzov Beymurod

1. Introduction
Seismic safety of construction is one of the most important tasks for the modern world. The development of new methods for the substantiation of seismic resistance of buildings is a task that is as important as ever. The present work is devoted to the study of the methods of substantiation of seismic resistance of buildings by the method of mathematical modeling.

2. Objectives
The main objective of the present work is to study the methods of substantiation of seismic resistance of buildings by the method of mathematical modeling. The objectives of the present work are to study the methods of substantiation of seismic resistance of buildings by the method of mathematical modeling. The objectives of the present work are to study the methods of substantiation of seismic resistance of buildings by the method of mathematical modeling.

3. Results
The results of the present work are presented in the form of a report. The results of the present work are presented in the form of a report. The results of the present work are presented in the form of a report.
